Presentation

## *Introduction*

- The Music Store Data Analysis project focuses on uncovering business insights from a digital music store's database using SQL.
- This analysis involves designing a relational database, importing structured data, and writing optimized SQL queries to answer key business questions. By exploring customer behavior, sales trends, and music preferences, this project helps identify opportunities to improve customer engagement and revenue.
- Through this project, we aim to transform raw data into valuable insights that support strategic decision-making across marketing, operations, and artist partnerships.

## Problem Statement

- The 🎵 *Music Store* holds rich data on customers, tracks, genres, artists, invoices, and playlists. Without proper analysis, this data remains underutilized and lacks strategic value.

This project aims to:

- ☐ Build a relational database with correct relationships
- 📥 Import large datasets efficiently into MySQL
- Analyze customer behavior, music trends, and sales performance
- 📊 Derive insights on top customers, popular genres, and regional revenue By
- converting raw data into meaningful insights, the project supports better decision-making and business growth.

## Conclusion

- The Music Store Data Analysis project successfully demonstrated how structured database design and advanced SQL queries can turn raw data into valuable business insights.
- By importing and analyzing data across multiple tables such as customers, invoices, tracks, and genres we were able to:
  - Identify top-performing customers and high-revenue regions
  - Discover popular music genres and top artists
  - Understand customer spending patterns and sales trends
- This project not only strengthened SQL and database management skills but also provided a practical understanding of how data-driven decisions can enhance business performance and customer engagement.
